PROFESSIONAL SUMMARY

SQL-focused Analytics Engineer with 5 years building end-to-end data solutions, from hand-written T-SQL and reporting through to production data warehousing, self-serve BI in Power BI and Tableau, and Python for automation and analysis. Led a 0-to-1 data warehouse transformation for a trucking and logistics company, replacing fragmented Excel and ad-hoc queries with a production-grade dimensional warehouse (star schema, SCDs, RLS-secured semantic models) across 7 source systems. Track record spans scalable dashboards and data products, automation with measurable cost savings, and scoring systems that inform operational decisions. Experienced across transportation, telecom, and gaming.

SKILLS

- **SQL & Databases:** Advanced T-SQL (window functions, CTEs, stored procedures, indexing, query tuning, error handling), SSMS, SSRS, SQL Agent jobs, data-quality checks & reconciliation
- **Data Warehouse & Modeling:** Dimensional modeling, star schema, SCD Types 1/2/3, surrogate keys, conformed dimensions, Kimball methodology
- **Analytics:** A/B testing, cohort analysis, RFM segmentation, K-Means clustering, LTV & churn modeling, funnel analysis
- **BI & Visualization:** Power BI (DAX, RLS, semantic models), Tableau, Looker
- **Data Engineering:** SQL (advanced), SSIS (incremental loads, SCD handling, error logging), ETL/ELT design, data marts, data lakes
- **Languages & Tools:** SQL, Python (Pandas, NumPy, Matplotlib), Git, SSMS, SSRS
- **Platforms:** SQL Server, Microsoft Fabric, Azure Data Factory, Snowflake

WORK EXPERIENCE

Analytics Engineer | Titanium Transportation Group Inc. | Toronto, ON

Apr 2023 - Present

- **0-to-1 Data Warehouse:** led end-to-end design and delivery of Titanium's first production data warehouse, replacing Excel reports and ad-hoc SSMS queries with a dimensional model (Kimball, star schema, SCD Types 1/2, surrogate keys, conformed dimensions) across **7 source systems** (TMW, Great Plains, DAT, Salesforce, Payroll, AR, AP).
- **Semantic Model & Self-Serve Platform:** designed a certified Power BI semantic layer with Row-Level Security (RLS) by department, enabling finance, ops, sales, and leadership to self-serve live warehouse data and eliminating a chronic ad-hoc reporting backlog -- a scalable data product built once and reused across the business.
- **Carrier Performance Scorecard:** built a scoring model ranking **1,200+ carriers** on tracing rate, on-time performance, and load hand-back rate using historical operational data. Integrated tiered scores directly into the dispatch system (TMW), substantially reducing the time dispatch spent manually researching carrier history; also drives a monthly carrier report card tied to incentive tiers to improve carrier behavior.
- **Cross-Departmental Dashboards:** built and maintain Power BI dashboards across sales (rep scoring, revenue and customer retention by rep, carrier assignment quality), executive (P&L and spend visibility, hidden cost analysis for C-suite), maintenance (repair cost, downtime, service tracking), and safety (driver violations, training completion, driver scorecards).
- **Voice AI Automation (HappyRobot):** designed and deployed a voice AI automation to conduct carrier pre-pickup calls (collecting truck/tractor numbers to initiate load tracking), replacing manual calls previously handled by a **4-person** tracking team. Saved **200+ hours (~\$18K)** in base labor cost to date and growing.
- **Fleet P&L Dashboard:** built a dimensional data model (fact/dimension structure in Power BI's semantic layer) integrating maintenance, fuel, tolls, revenue, AP/AR, and depreciation data across **~700 trucks/drivers** monthly. Powers unit-level profitability reporting used in monthly leadership reviews to drive pricing and operational decisions.
- **Python Automation & Analysis:** used Python (Pandas, NumPy) to automate recurring data pulls, validate source data before it reached the warehouse, and run ad-hoc analysis outside the Power BI pipeline.

Data Consultant | QNE Software (Client: Telus International) | Toronto, ON

Jul 2022 - Mar 2023

- **Subscriber Lifecycle Dashboards:** built dashboards tracking acquisition, churn, ARPU, and retention for prepaid users, used in ongoing reviews by marketing and product leadership.
- **Cohort Retention Analysis:** conducted cohort-based retention analysis by tenure, usage, and plan type; informed retention interventions in pilot regions.
- **Marketing Attribution Modeling:** built attribution models linking channel spend to ARPU uplift and LTV, providing ROI visibility on acquisition spend.
- **Activation & Onboarding:** defined activation KPIs and diagnosed onboarding drop-off with lifecycle product teams, improving early-stage conversion and retention.

- **A/B Testing:** ran significance tests on gameplay mechanics and promotions to inform retention and engagement decisions.
- **Player Segmentation:** built RFM and K-Means models to classify VIP, churn-risk, and reactivation cohorts.
- **Funnel Optimization:** instrumented GA4 and GTM across registration-to-deposit funnels; identified friction points improving first-deposit conversion.
- **LTV & Churn Modeling:** developed LTV and churn propensity models from transaction and behavioral data.
- **Executive Dashboards:** built Tableau and Looker dashboards monitoring DAU/WAU, revenue trends, deposit velocity, and cohort retention for product leadership.

PROJECTS

- **Internal RAG System (In Progress)** — Building a Retrieval-Augmented Generation system on internal company databases enabling natural language querying of structured operational data. Exploring LLM integration patterns, vector retrieval, and embedding strategies for tabular data.

EDUCATION

Business Analytics St. Lawrence College, Kingston, Canada

2021 - 2022

B.Sc. Economics Symbiosis School of Economics, Pune, India

2015 - 2018
